POST-OP INSTRUCTIONS AFTER KNEE PARTIAL MENISCECTOMY

- Certain anesthetics and pain medications may produce nausea and vomiting in certain individuals. If nausea becomes a problem at home, call our office.
- A prescription for pain will be e-prescribed to your pharmacy 2 days before your surgery. Take the medication as needed. You should be able to transition to Tylenol or NSAIDs around 3 days after surgery.
- Keep the operative dressing dry for 72 hours. You may remove after 3 days and place waterproof bandages over the incisions. You are then able to shower like normal. Do not soak in a tub or pool.
- Limit your activity initially. As you feel more comfortable, slowly increase your ADLs as tolerated. You can weight bear as tolerated and may use crutches/walker as needed.
- Elevate the operative knee as often as possible to help with swelling. Do not allow knee to be held in a flexed position for prolonged amounts of time (make an effort to move your knee).
- Notify your physician for:
 - A. Temperature over 101.5 degrees or severe chills.
 - B. Severe pain not relieved by prescribed medications.
 - C. Numbness, redness, or tingling of operative extremity.
 - D. Excessive swelling, paleness or coldness of operative extremity as compared to other.
- A member of our staff will call the day after surgery to see how you are doing and answer any questions you may have.
- Ice operative site for 20 minutes every hour as needed for symptomatic relief.
- Additional instructions: If taking pain medication, drink plenty of water and take fiber to avoid constipation.
- Keep your post-operative appointment at Coastal Orthopedics.

Any questions or concerns call our office staff at (361) 994-1166.
